Novel secreted and membrane-associated polypeptides and polynucleotides useful for preventing, ameliorating or correcting dysfunction or disease including diabetes, cancer, hypertension and growth abnormalities.

```
NOV60C protein sequence, SEQ ID 142.
                                                                                                                                                     The invention relates to secrete and memorane-associated polypeptides and polypurcleotides. The sequences of the invention are useful in diagnostic assays for detecting diseases associated with inappropriate activity or levels of these polymucleotides, and in identifying their agonists and antagonists that are potentially useful in therapy. The sequences of the invention are useful as vaccines for inducing in therapy. The sequences of the invention are useful for immunological response. The sequences of the invention are useful for inducing cancers, infections, autoimmune disorders, haematopoietic disorders, wound healing disorders (chlosteryl ester storage disease, inflammation, congenital muscular dystrophy, junctional epidermolysis curl and bacterial infections, Alzheimer's disease, asthma, arthritis, allergies, schizophrenia, sbg442445PROa-associated disorders, viral and bacterial infections, Alzheimer's disease, asthma, arthritis, allergies, schizophrenia, sbg442445PROa-associated disorders, care host disease, ischaemia, stroke, acute respiratory disease syndrome, restenosis, brain injury, AIDS, bone diseases, atherosclerosis, care host disease, ischaemia, stroke, acute respiratory disease condisoraters including paraeupranuclear paley, mycorolic dystrophy, depression, anxiety disorders and aleep disorders palmonary disease.

Compared to and activities and adult respiratory distress syndrome, crapical procession, anxiety disorders and aleep disorders including chronic respiratory disease including congestive heart failure and mycoardial infarction, and non-viral hepatitis, type II diabetes mellitus, renal disease including acute and chronic remal failure, glomerulonephritis, Panconi's controluding acute and chronic remal failure, and mon-viral hepatitis, type II diabetes mellitus, renal disease and tendinitis, gastrointestinal diseases including low testosterome and male infertility.

Compared to the present sequence is human tectorin beta procten
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The present invention relates to novel human NOVX proteins, where X is any number from 1 to 91 and their coding sequences. The proteins and coding sequences are useful for preventing or treating disorders or syndromes e.g. atherosclerosis, hypertension, obesity or cancer. NOV60 is a beta tectorin-like protein and its coding sequence maps to chromosome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Peyman JA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò
                                                        The invention relates to a novel isolated polypeptide (NOVX). A polypeptide of the invention has cytostatic, immunomodulator, neuroprotective, noctropic, antidiabetic, antidiabetic and an appearance of any of the 303 fully defined nucleotide sequences given in the populypeptide is useful in the manufacture of a medicament for treating a syndrome associated with a human disease. The polypeptide, polynucleotide and antibody are useful in diagnosing, treating or preventing Novassociated disorders, e.g. cancer, cachexia, Alzheimer's disease, Parkinson's disease, obesity, diabetes, infectious diseases, metabolic syndrome X or dyslipidaemias. The nucleic acids are typing, preventive medicine, and pharmacogenomics. The present sequence typing, preventive medicine, and pharmacogenomics. The present sequence

The present invention relates to novel human NOVX proteins, where X is any number from 1 to 91 and their coding sequences. The proteins and coding sequences are useful for preventing or treating disorders or syndromes e.g. atherosclerosis, hypertension, obesity or cancer. NOV60 is a beta tectorin-like protein and its coding sequence maps to chromosome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61 NGVHEGGYYQFVIPDLSPKNKSYCGTQSEYKPPIYHFYSHIVSNDTTVIVKNQPVNYSFS 120

A polypeptide of the invention has cytostatic, immunomodulator, neuroprotective, nootropic, anorectic, antidiabetic, antimicrobial, and antilipaemic activity, and may have a use in gene therapy, and as a vaccine. The polypeptides are encoded by NOVX polymucleotides comprising any of the 303 fully defined nucleotide sequences given in the specification. The polypeptide is useful in the manufacture of a medicament for treating a syndrome associated with a human disease. The

polypeptide, polynucleotide and antibody are useful in diagnosing, treating or preventing NOVX-associated disorders, e.g. cancer, cachexia, Alzheimer's disease, Parkinson's disease, obesity, diabetes, infectious diseases, metabolic syndrome X or dyslipidaemias. The nucleic acids are further used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The present sequence represents a NOVX polypeptide of the invention.

The present invention relates to novel human NOVX proteins, where X is any number from 1 to 91 and their coding sequences. The proteins and coding sequences are useful for preventing or treating disorders or syndromes e.g. atherosclerosis, hypertension, obesity or cancer. NOV60 is a beta tectorin-like protein and its coding sequence maps to chromosome
                                                                                                                                                                                                                                                                                                                                                      Peyman JA;

The invention relates to a novel isolated polypeptide (NOVX). A polypeptide of the invention has cytostatic, immunomodulator, neuroprotective, notropic, antidiabetic, antidiabetic and antidiabetic antidiabetic comprising or the polypeptide are encoded by NOVX polymucleotides comprising medicament for treating a syndrome associated with a human disease. The specification. The polypeptide and antibody are useful in diagnosing, treating or preventing NOVX-associated disorders, e.g. cancer, cachexia, alzheimer's disease, Parkinson's disease, obesity, diabetes, infectious diseases, metabolic syndrome of disease, obesity, diabetes, infectious contrater used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The present sequence represents a NOVX polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Alsobrook JP, Alvarez E, Anderson DW, Boldog FL, Casman SJ; Catterton E, Chapoval A, Crabtree-Bokor JR, Edinger SR, Ellerman K; Ettenberg S, Gangolil EA, Gerlach VL, Gorman L, Gunther E, Guo X; Gusev VY, Herrmann JL, Ji W, Kekuda R, Li L, Liu X, Macdougall JR; Maclachlan T, Malyankar UW, Mezick AJ, Millet I, Mishra VS; Padigaru W, Pena CEA, Peyman JA, Raha D, Rastelli L; Rieger DK, Rothenberg ME, Sciore P, Shenoy SG, Shinkets RA; Sinthson G, Spytek KA, Stone DJ, Vernet CAM, Voss EZ, Zhong M;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9-JUN-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               7-JUN-200
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1-JUN-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          13-JUN-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     4-JUN-2
                                             The invention relates to a novel isolated polypeptide (NOVX). A polypeptide of the invention has cytostatic, immunomodulator, neuroprofective, nootropic, antofiabetic, antidiabetic, and may have a use in gene therapy, and as a carrillogement of the solypeptides are encoded by NOVX polynucleotides comprising to pecification. The polypeptide is useful in the manufacture of a medicament for treating a syndrome associated with a human disease. The polypeptide, polymorleotide and antibody are useful in diagnosing, treating or preventing NOVX-associated disorders, e.g. cancer, cachexia, Alzheimer's disease, metabolic syndrome X or dyslipidaemias. The nucleic acids are further used as hybridisation probes, in chromosome mapping, tissue typing, preventive mediciane, and pharmacogenomics. The present sequence typing, preventive mediciane, and pharmacogenomics. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       257
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             61 PKNKSYCGTQSEYKPPIYHFYSHIVSNDTTVIVKNQPVNYSFSCTYHSTYLVNQAAFDQR 120

The invention describes a novel polypeptide-cytochrome b45.65 (I), its encoding polynucleotide (II), the production of (I) using DNA recombination technology. Also described are an antagonist for resisting therapeutic action of (I) and the application of (II). (I) is used to treat several diseases, such as mailgnant tumour, haemopathy, Human immunodeficiency virus (HIV) infection, immunological disease and various inflammations. This is the amino acid sequence of the novel cytochrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     66 GGYYQFVIPDLSPKNKSYCGTQ-----SEY----KPPIYHFYSHIVSNDTTVIVKN 112

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         polypeptide of the invention has cytostatic, imminomodulator, neuroprotective, nootropic, anotectic, antidiabetic, antimicrobial, and neuroprotective, nootropic, anoectic, antidiabetic, antimicrobial, and neuroprotective, nootropic, anoectic, antidiabetic, antimicrobial, and neuroprotective, nootropic, anoectic, antidiabetic, and neuroprotectide are encoded by NOWX polymucleotides comprising any of the 303 fully defined nucleotide sequences given in the medicament for treating a syndrome associated with a human disease. The polypeptide, polymucleotide and antibody are useful in diagnosing, treating or preventing NOWX-associated disorders, e.g. cancer, cachexia, Alzheimer's disease, Parkinson's disease, obssity, diabetes, infectious diseases, metabolic syndrome X or dyslipidaemias. The nucleic acids are typing, preventive medicine, and pharmacogenomics. The present sequence typing, preventive medicine, and pharmacogenomics. The present sequence

This sequence represents rat uromodulin (UMOD). The cDNA encoding this sequence was used in the method of the invention for diagnosing a disease or a predisposition to contract a disease. The method comprises obtaining genetic material from a test subject and assaying the genetic material to detect a mutation in at least a copy of the UMOD genetic sequence, where the presence of a UMOD mutation supports a dispansis of a disease or a predisposition to contract a disease within the patient. The method also comparises comparing the sequence of the genetic material of the sequence of the wild-type UMOD gene and identifying any differences between the sequence of the genetic material and the wild-type UMOD gene. The method is useful for diagnosing renal diseases or a predisposition to renal diseases, e.g. medullary cystic kidney disease 2 (MCKD2), familial juvenile gouty mephropathy (FUGN), renal failure, hyperuricaemia, gouty
                 medullary cystic kidney disease 2; MCKD2;

```
This sequence represents murine uromodulin (UMOD). The cDNA encoding this sequence was used in the method of the invention for diagnosing a disease or a predisposition to contract a disease. The method comprises obtaining genetic material from a test subject and asyling the genetic material to detect a mutation in at least a copy of the UMOD genetic sequence, where the presence of a UMOD mutation supports a diagnosis of a disease or a predisposition to contract a disease within the patient. The method also comprises comparing the sequence of the genetic material of the sequence of the wild-type UMOD gene and identifying any differences between the sequence of the genetic material and the wild-type UMOD gene. The method is useful for diagnosing renal diseases or a predisposition to renal diseases, e.g. medullary cystic kidney disease 2 (MCKD2), familial invenile gouty nephropathy (FUGN), renal failure, hyperuricaemia, gouty
                                                                                                                                                                                                                                                                          medullary cystic kidney disease 2; MCKD2;
familial juvenile gouty nephropathy; FJGN; renal failure; hyperuricaemia;
gouty arthritis; enuresis.
                                                                                                                                                                                                                                         human; bovine; murine; rat; uromodulin; UMOD; assay; detection; mutation; wild-type; diagnosis; renal disease; predisposition;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Diagnosing renal diseases or a predisposition to renal diseases, e.g. renal failure, hyperuricemia, gouty arthritis or enuresis comprises assaying a genetic material to detect a mutation in at least a copy of the uromodulin genetic sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DB 8; Length 642;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell prollferative disorders, autoimmune/inflammatory disorder, developmental disorders, endorrine disorder, neurological disorders, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp molecules may also be used in genetic mapping, in identifying individuals

The invention relates to novel diagnostic and therapeutic polymucleotides selected from one of the 2722 sequences defined in the specification. A purpurelectide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polymucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine disorder, neurological disorder, developmental disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp infections caused by virus, bacteria, fungi or parasite or germline polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline invention. Note: The sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm

```
This sequence represents bovine uromodulin (UMOD). The cDNA encoding this sequence was used in the method of the invention for diagnosing a disease or a predisposition to contract a disease. The method comprises obtaining genetic material from a test subject and assaying the genetic material to detect a mutation in at least a copy of the UMOD genetic sequence, where the presence of a UMOD mutation supports a diagnosis of a disease or a predisposition to contract a disease within the patient. The method also comprises comparing the sequence of the genetic material of the sequence of the wild-type UMOD gene and identifying any differences between the sequence of the genetic material and the wild-type UMOD gene. The method is useful for diagnosing renal diseases or a predisposition to renal diseases, e.g. medullary cystic kidney disease 2 (MCKD2), familial juvenile gouty nephropathy (FJGN), renal failure, hyperuricaemia, gouty
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           135 DQRVATVHVKNGSMGTFESQLSL-----NFYTNAKFSIKKEAPFVLEASEIGSDLFAG 187
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         188 VEAKGLSIRFKVVLNSCWATPSADFMYPLQWQLINKGCP--TDETVLVHENGRDHRATFQ 245

Sequence 6085, Application US/09949016

Patent No. 6812339

GENERAL INFORMATION:

APPLICANT: VENTER, J. Craig et al.

TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED

TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF

FILE REPREMENCE: CL001307

CURRENT APPLICATION NUMBER: US/09/949,016

CURRENT PILING DATE: 2000-04-14

PRIOR PEPLICATION NUMBER: 60/241,755

PRIOR PEPLICATION NUMBER: 60/237,768

PRIOR FILING DATE: 2000-10-03

PRIOR FILING DATE: 2000-10-03

PRIOR FILING DATE: 2000-10-03

PRIOR FILING DATE: 2000-09-08

NUMBER OF SEQ ID NOS: 207012

SOUTHWARE: FREEE PERLS OF WINDOWS VERSION 4.0

j Patent No. 681239

4 GENERAL INFORMATION:

APPLICANT: VENTER, J. Craig et al.

TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED

TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF;

FILE REPRENENCE: CLOOL307

CURRENT APPLICATION NUMBER: US/09/949,016

CURRENT FILING DATE: 2000-04-14

PRIOR PILING DATE: 2000-10-20

PRIOR PILING DATE: 2000-10-03

PRIOR PILING DATE: 2000-10-03

PRIOR PILING DATE: 2000-09-06

NUMBER OF SEQ ID NOS: 207012

SOFTWARE: FREESEQ for Windows Version 4.0

SEQ ID NO 8534
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 8535, Application US/09949016

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Biol. Chem. 272:8791-8801(1997).

-I-FUNCTION: One of the major non-collagenous components of the tectorial membrane is an tectorial membrane (By similarity). The tectorial membrane is an extracellular matrix of the inner ear that covers the extracellular matrix of the inner ear that covers the neuroepithelium of the cochlea and contacts the stereocilia bundles of specialized sensory hair cells. Sound induces movement of these hair cells relative to the tectorial membrane, deflects the stereocilia and leads to fluctuations in hair-cell membrane

potential, transducing sound into electrical signals.
-!-SUBUNTY: May form homomeric filament after self-association or heteromeric filament after association with alpha-tectorin.
-!-SUBUNTY: Matached to the membrane by a GPI-anchor (Probable). Found in the non-collagenous matrix of the tectorial membrane (By similarity).
-!-DOMAIN: Zona pellucida domain may enable to form filaments.
-!-PTM: The presence of a hydrophobic C-terminus preceded by a potential cleavage site strongly suggests that tectorins are synthesized as glycosylphosphatidylinositol-linked, membrane-bound precursors. Tectorins are targeted to the apical surface of the inner ear epithelia by the lipid and proteolytically released into the extracellular compartment.
-!-SIMILARITY: Contains 1 ZP domain.
                                                                                                                                                                                                                                                                                                                                                                        This SWISS-PROT entry is copyright. "Molecular markers for cell types of the inner ear and candidate genes
for hearing disorders", S. 95:11400-11405(1998).

-1- FUNCTION: One of the major non-collagenous components of the
tectorial membrane The tectorial membrane is an extracellular
matrix of the inner art that covers the neuroepitchelium of the
cochlea and contacts the stereocilia bundles of specialized
sensory hair cells. Sound induces movement of these hair cells
relative to the tectorial membrane, deflects the stereocilia and
leads to fluctuations in hair-cell membrane potential, transducing
sound into electrical signals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PTM: N-glycosylated. The presence of a hydrophobic C-terminus preceded by a potential cleavage site strongly suggests that tectorins are synthesized as glycosylphosphatidylinositol-linked, membrane-bound pecursors. Tectorins are targeted to the apical surface of the inner ear epithelia by the lipid and proteolytically released into the extracellular compartment.
                                                                                                                                                                                                                                                                                                                                                                                                      Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

SUBCELLULAR LOCATION: Attended to the membrane by a GPI-anchor (Probable). Found in the non-collagenous matrix of the tectorial membrane (By similarity).

TISSUE SPECIFICITY: Exclusively expressed in the inner ear, where it is found in basilar papilla, clear cells, suppporting cells, cuboidal cells and the lagena macula.

POMAIN: Zona pellucida domain may enable to form filaments.

PTM: N-glycosylated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SEQUENCE FROM N.A.                                      Mutations in the human alpha-tectorin gene cause autosomal dominant non-syndromic hearing impairment.";

"Mutations in the human alpha-tectorin gene cause autosomal dominant non-syndromic hearing impairment.";

Nat. Genet. 19:60-62(1998).

-I- FUNCTION: One of the major non-collagenous components of the caterorial membrane is an extracellular matrix of the inner ear that covers the caterorial membrane is an extracellular matrix of the inner ear that covers the neuroepithelium of the cochlea and contacts the stereocilia neuroepithelium of the cochlea and contacts the stereocilia call relative to the tectorial membrane deflects the stereocilia and leads to fluctuations in hair-cell membrane contential, transducing sound into electrical signals.

--- SUBUNIT: May form homomeric filament after self-association or heteromeric filament after association with beta-tectorin.

--- SUBUNIT: May form homomeric filament after self-association or heteromeric filament after association with beta-tectorin.

--- SUBCELLULAR LOCATION: Attached to the membrane by a GPI-anchor (Probable). Found in the non-collagenous matrix of the tectorial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Isold=008523-2; Sequence=VSP 010557;
TISSUE SPECIFICITY: Cochlea-specific.
DOMAIN: Zona pellucida domain may enable to form filaments.
PTM: 3 products of tectorin seem to exist: HPM, MPM and LMM. They may be generated by active processing or the result of proteolysis occurring between intrachain disulfid bonds.
PTM: The presence of a hydrophobic C-terminus preceded by a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      potential cleavage site strongly suggests that tectorins are synthesized as glycosylphosphatidylinositol-linked, membrane-bound precursors. Tectorina are targeted to the apical surface of the inner ear epithelia by the lipid and proteolytically released into
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        MGD; MGI:109575; Tecta.
